$\omega_{THICK,W}$		0.0517	0.1622						-0.4550	0.1394	-0.1389	0.1089
$\omega_{MATURE,W}$		-0.1075	0.0809						0.0136	0.0846	0.0946	0.0646
$\log \sigma_\epsilon$	-1.1807	0.0135	-1.1829	0.0138	-0.5601	0.0109	-1.0264	0.0111	-0.5940	0.0109	-1.0316	0.0111
$\log \sigma_\nu$	-0.7885	0.0016	-0.7885	0.0016	-0.7884	0.0016	-0.7885	0.0016	-0.7884	0.0016	-0.7885	0.0016
Township FE	No		No		No		Yes		No		Yes	
Overall $R^2$	0.7385		0.7389		0.5046		0.6900		0.5213		0.6915	
Between $R^2$	0.8093		0.8100		0.2668		0.7056		0.3130		0.7087	

# Wells = 4,408, # Well-months = 193,846. “Between”  $R^2$  is the  $R^2$  for the average predicted log baseline production. The  $R^2$  for the predicted time series of production is .6717 for all specifications. Maximum likelihood estimates of Cobb-Douglas production function models:

$$\log Y_{it} = \alpha + \beta \log t + \delta \log D_{it} + \eta \log H_i + m(Z_i, R_i | \omega) + \tau_i + \epsilon_i + \nu_{it}$$

and Gaussian process production function models:

$$\log Y_{it} = \alpha + \beta \log t + \delta \log D_{it} + \eta \log H_i + f(Z_i, R_i | \gamma, \omega) + \epsilon_i + \nu_{it}$$

$Y_{it}$  is oil production for well  $i$  when it is  $t$  months old,  $D_{it}$  is the number of days producing,  $H_i$  is the horizontal length,  $R_i$  is the vector of organic content, thickness and maturity, and  $Z_i$  is the vector of sand use  $S_i$ , water use  $W_i$ , latitude  $lat_i$  and longitude  $lon_i$ .  $\tau_i$  is a set of township fixed effects.
